

2016 Annual Residential Well Sampling Report

Project No: 1036-10081

Prepared For:

Franklin Waste Facility Monitoring Committee

Prepared By:

WHAT WE DO TODAY TOUCHES SEVEN GENERATIONS.

(Intentionally Blank)

In May of 1992 an agreement between The Waste Management Metro Landfill and Recycling Facility (Waste Facility) and the neighboring Municipalities was signed; a Host agreement. This agreement defined the rights and responsibilities of a Monitoring Committee that would be made up of representatives from the neighboring municipalities and the “host” community, City of Franklin. The Monitoring Committee was titled the Franklin Waste Facility Monitoring Committee (Franklin WFMC). The other communities with seats on the Franklin WFMC are:

- Milwaukee County
- Waukesha County
- Racine County
- City of Muskego
- Town of Raymond
- Town of Norway

One of the responsibilities of the Waste Facility is to procure annual sampling and testing of thirty five (35) residential wells, selected by the Franklin WFMC. The samples undergo testing for constituents regulated by both the Primary and Secondary Federal Drinking Water Standards. The results of this testing is presented to the Franklin WFMC by the Waste Facility.

In 1996 the Franklin WFMC initiated a contract with Environmental Graphics, Inc.; a consultant to analyze the results from the Annual Residential Well Sampling and provide a report summarizing results, recording sampling history, and providing recommendations for the subsequent annual sampling. In 2003, the Franklin WFMC engaged the services of Ruekert Mielke, Inc. to perform the Annual Residential Well Sampling Report Contract for 2003 through 2005. The Franklin WFMC awarded the 2006-Annual Residential Well Sampling Contract to JSA Civil Environmental Engineers, Inc. (JSA). JSA has maintained the contract since 2006.

This year, 2016, the Franklin WFMC again appointed Davy Laboratories¹ to perform the sampling and testing of the 35 wells. Davy had been selected the previous three years, following an open bid process and the previous years sampling protocols were in compliance with the contract between the Franklin WFMC and the Waste Facility.

JSA initiated the 2016 contract by reviewing the findings from the August 22, 2016 testing of the 35 residential wells, sampled on July 16th of 2016. JSA also made the commitment to generate this report, maintain the historic database, and aid the Franklin WFMC in the selection of the 35 residential wells for sampling in 2017.

On November 3, 2016; JSA has completed Tasks 1,2, and 3 of the “Annual Well Sampling Report”, by submitting the Well Sampling Report to the Franklin WFMC. This report includes a Map of Wells Sampled, Table 1- 2016 Residential Well Sampling, Table 2 – Historic Sampling Summary, Table 3 – 2016 Residential Well Samples Exceeding the Federal Secondary Drinking Water Standard, Table 4 – History of Constituents Detected Above LOD. All tables have been sized to fit on standard Letter paper and when applicable are produced in duplex, however Table 2 and the map still require 11”x17” formatting.

¹ Davy Laboratories, 115 Sixth Street, P.O. Box 2076, Lacrosse, WI 54602-2076
Performed sampling and analysis in 2009 thru 2014.

Wells Sampled

In June 2016, JSA made recommendations to the Franklin WFMC for the selection of the 35 residential wells for the 2016 sampling. Wells were selected based on past sampling frequency, most recent sampling, and potential for trend analysis in organic constituents detected; as recommended in the 2015 Annual Residential Well Sampling Report. All wells selected were sampled in 2016. Three (3) new wells were sampled in 2016 all new construction. Well sampling frequency was focused on newer wells and wells that had had limited sampling to date. Sampling this year did include properties adjacent to the WMWI Metro Waste and Recycling Facility both North and South. As the landfill has purchased all properties along 112th Street, there is no opportunity to sample wells adjacent to the facility to the East. Several of the purchased properties are now the location of required Monitoring Wells for current operations and future expansions of the Metro Facility.

The sampling was performed by Davy Laboratories on July 16th of 2016. The locations are marked on MAP 1 of the report, using Tax ID to identify the property that the well is located on. The Well location data is found in Table 1, providing Property Owner, Property Address, and previous sampling date.

Davy sampled only from external locations when possible, with immediate connections to the well. They performed purging (discharging of water from the well for at least two minutes) prior to all sample gathering. Samples were handled and returned to the lab following protocols established by the US EPA for drinking water sampling and testing.

Samples are evaluated in the field and in the laboratory, these are defined as field and analytical results. In the field Davy's technicians record the follow:

- Specific Conductance – electrical conductivity of the sample
 - Contamination by Landfill gas or leachate raises specific conductance
- Odor – a subjective analysis done by the technician
 - The presence of organic materials and/or chemistry can create odors in groundwater.
- pH – acidic/basic analysis of the sample
 - Groundwater, in Wisconsin, is typically neutral to basic; landfill leachate or gas is predominantly acidic and if present in the sample would lower the pH (make more acidic)
- Temperature – recorded in centigrade
 - Groundwater, in Wisconsin, ranges from 50 to 60 degrees depending on depth and recharge rate of the aquifer. The introduction of chemical reactions and organic degradation raises temperatures. Higher than expected temperatures can also be an indication of inadequate purging, which is addressed by re-purging and sampling.
- Turbidity – a measure of the transparency of the sample
 - Turbidity in surface water is an excellent measure of water quality, in groundwater it suggests further testing. It is a very good indicator of the current quality of the well

construction itself.

Field results are water quality indicators that can often be used to identify potential contamination to be discovered in the analytical results. Davy technicians would flag field results that were outside the norm for groundwater in the Franklin, WI area. All the samples were within the normal parameters for the area and in addition were consistent with previous sampling events.

Federal Primary Drinking Water Standards

In 2015 the US EPA updated the Federal Primary Drinking Water Standards Maximum Contaminant Level (MCL) for several constituents that are in the protocols. The majority of these constituents are heavy metals, none of the affected constituents have ever been detected in the Franklin WFMC Annual Residential Well Sampling history.

The 2016 Annual Residential Well Sampling Laboratory Testing yielded no constituents that exceeded the Federal Primary Drinking Water Standards Maximum Contaminant Level (MCL). No wells contained constituents above the identified MCL.

The Wisconsin Department of Natural Resources also maintains a set of parameters for groundwater contaminants. All constituents detected in the Well Sampling are found in NR 140 – Groundwater Quality. The Public Health Groundwater Quality Standards are similar to the Federal Primary Drinking Water standards. No VOC's detected in the Annual 2016 Well Sampling, therefore no samples had constituents that exceeded the Preventative Action Limit (PAL), therefore no constituents that exceeded the Enforcement Standard.

Federal Secondary Drinking Water Standards

The secondary standards act as guide lines for public water systems. Each well that had been previously sampled was compared to its past history. The 2016 Well Samples are predominantly consistent with the Well Sampling history and with the groundwater constituents of Southeastern Wisconsin. However, the sulfate content in the Thiessenhusen well has increased to a point that the owners should be informed that it is potentially unsafe for infant consumption.

Of the constituents measured under the Federal Secondary Drinking Water Standards, Iron (Fe) and Sulfate (SO₄) are detected in excess. Thirteen (13)² wells had Iron concentrations higher than 0.30 milligrams per liter (mg/L) and six (6)³ wells had Sulfate concentrations equal to or greater than 250 mg/L. With the exception of the Acker well, there is no indication to suggest that these concentrations are anything other than naturally occurring and have been consistent over more than 15 years of sampling and testing. The Acker well is at 2.380 mg/L which is a significant reduction over previous samplings. It is probable that the increase in iron is due to an issue with the plumbing between the sampling point and the screen in the well. It is unlikely that the iron content in the Acker well is naturally occurring.

In past years of sampling many wells had Sulfate concentrations above 250 mg/L; the majority of these wells are now owned by the landfill or are outside of the defined sampling

2 See Table 3 Results Fe+

3 See Table 3 Results SO₄

area. The Thiessenhusen well has doubled the sulfate concentration, as recorded in previous samples. This can be the result of rock fracture (new wells) in the area or simply leaching of the current subsurface materials, without the detection of contaminants there is no reason to suggest that the sulfate is not naturally occurring. The high sulfate content should have an impact on the taste of the water and can potentially cause diarrhea (can cause dehydration in infants). JSA recommends re-sampling of the well to see if the concentration was a unique occurrence or a consistent parameter.

Trending

The 2016 Well Sampling results, consistent with the 2016 results, continue to support that there is no current trending with respect to Federal Primary Drinking Water Standards. The only well in the 2016 sampling event that had a past detection, was the Thiessenhusen well in 2012. The well had been “cleaned” earlier in that year and the constituent's presence was believed to be a byproduct of inaccurate chlorination. The previous history of the well, which was first sampled in 1999 and last sampled in 2015 is without detects; supporting the assumption that the detected chloroform was from improper well management and not another source.

With respect to the Federal Secondary Drinking Water Standards, trending is recorded throughout the history of the Annual Residential Well Sampling Reports. Both Iron and Sulfate are tracked in every report. Wells that have a history of sulfate in excess of the Secondary Drinking Water Standards do not show deviation in greater than 20%, trending is negative; or concentrations decrease each sampling event; which is expected. This trend in Sulfate is not accurate with respect to the Thiessenhusen well, which increase in Sulfate has gone up since first detected in 2013 is now double its 2015 level. This deviation is inconsistent with all other well results. Iron trending is similarly negative even in the Acker well; iron not only occurs in subsurface conditions (soil and groundwater), but is also an indicator of unique well health, and site plumbing. To date higher than expected iron concentrations have been attributed to site plumbing and corrected with plumbing or well repairs.

Conclusions

The 2016 Well Sampling Laboratory Results yielded no exceedance of the established MCLs for all constituents. This is what should be expected in a sampling event and is most probably an example of improved well protection by well owners and improvements in the technology and protocols of sampling and testing.

The subject wells sampled were consistent with historic sampling results with respect to The US EPA Secondary Drinking Water Standards, exceedance was found in Iron and Sulfate concentrations; but do not pose a threat to public health. However, the owners of the Acker well should have their plumbing systems evaluated by a professional to see if repairs are required; and the owners of the Thiessenhusen well should have their well re-sampled and consider water treatment for the high sulfate concentrations.

Recommendations

JSA recommends that sampling for the 2017 report be focused on new wells and wells with close proximity to the landfill. When Waste Management purchases residences about the landfill, the associated wells are removed from the Annual Well Sampling Program and

sampling adjacent to the landfill occurs less frequently. Wells along 92nd Street should be viewed as “adjacent” to the Facility and a focus for future sampling.

JSA recommends that the Thiessenhusen well be sampled in 2017 and any wells that are available adjacent to them.

Franklin Waste Facility Monitoring Committee
2014 Well Monitoring Report

Table 4 Historic Residential Well Samples Exceeding Constituent LOD
Legend

<u>Formula</u>	<u>Compound Name</u>	<u>Use or History</u>
Fe	Fe	Secondary Drinking Water Standard in exceedance
SO ₄	SO4	Secondary Drinking Water Standard in exceedance
CCl ₂ F ₂	Dichlorodifluoromethane	A CFC known as R-12 and a spray propellant
C ₆ H ₅ CH ₃	Toluene	Commonly used solvent
TCE	Trichloroethylene	Commonly used solvent
CHCl ₃	Chloroform	Commonly a product of improper chlorination
CHBrCl ₂	Bromodichloromethane	Commonly a product of improper chlorination
CHBr ₂ Cl	Chlorodibromomethane	Commonly a product of improper chlorination
CH ₃ Cl	Chloromethane	Commonly known as R-40, also known as methyl chloride
C ₈ H ₁₀	Ortoxylene	Known as O-xylene, used in polymerizations and as a solvent
C ₉ H ₁₂	1,2,4Trimethylbenzene	Occurs in coal tar, petroleum, often by product of combustion
C ₈ H ₈	Styrene	Commonly used in the production of polymers and resins
CH ₃ CCl ₃	1,1,1 Trichloroethane	Commonly used as a solvent
