

2011 Annual Residential Well Sampling Report
Project No: 1036-10081

Prepared For:
Franklin Waste Facility Monitoring Committee

Prepared By:

WHAT WE DO TODAY TOUCHES SEVEN GENERATIONS.

In May of 1992 an agreement between The Waste Management Metro Landfill and Recycling Facility (Waste Facility) and the neighboring Municipalities was signed; a Host agreement. This agreement defined the rights and responsibilities of a Monitoring Committee that would be made up of representatives from the neighboring municipalities and the “host” community, City of Franklin. The Monitoring Committee was titled the Franklin Waste Facility Monitoring Committee (Franklin WFMC). The other communities with seats on the Franklin WFMC are:

- Milwaukee County
- Waukesha County
- Racine County
- City of Muskego
- Town of Raymond
- Town of Norway

One of the responsibilities of the Waste Facility is to procure annual sampling and testing of thirty five (35) residential wells, selected by the Franklin WFMC. The samples under go testing for constituents regulated by both the Primary and Secondary Federal Drinking Water Standards. The results of this testing is presented to the Franklin WFMC by the Waste Facility.

In 1996 the Franklin WFMC initiated a contract with Environmental Graphics, Inc.; a consultant to analyze the results from the Annual Residential Well Sampling and provide a report summarizing results, recording sampling history, and providing recommendations for the subsequent annual sampling. In 2003, the Franklin WFMC engaged the services of Ruekert Mielke, Inc. to perform the Annual Residential Well Sampling Report Contract for 2003 through 2005. The Franklin WFMC awarded the 2006-Annual Residential Well Sampling Contract to JSA Civil Environmental Engineers, Inc. (JSA). JSA has maintained the contract since 2006.

This year, 2011, the Franklin WFMC appointed Davy Laboratories¹ to perform the sampling and testing of the 35 wells. Davy had been selected the previous two years, following an open bid process and the previous years sampling protocols were in compliance with the contract between the Franklin WFMC and the Waste Facility.

JSA initiated the 2011 contract by reviewing the findings from the August 2011 testing of the 35 residential wells, sampled in July of 2011. JSA also made the commitment to generate this report, maintain the historic database, and aid the Franklin WFMC in the selection of the 35 residential wells for sampling in 2012.

On November 3, 2011, JSA has completed Tasks 1,2, and 3 of the “Annual Well Sampling Report”, by submitting the Well Sampling Report to the Franklin WFMC. This report includes a Map of Wells Sampled, Table 1- 2011 Residential Well Sampling, Table 2 – Historic Sampling Summary, Table 3 – 2011 Residential Well Samples Exceeding the Federal Secondary Drinking Water Standard, Table 4 – History of Constituents Detected Above LOD; and an additional map detailing the location of historic Dichlorodifluoromethane detections. All tables have been sized to fit on standard Letter sized paper and when applicable are

¹ Davy Laboratories, 115 Sixth Street, P.O. Box 2076, Lacrosse, WI 54602-2076
Performed sampling and analysis in 2009 thru 2011.

produced in duplex, however the maps still requires 11"x17" formatting.

Wells Sampled

In June 2011, JSA made recommendations to the Franklin WFMC for the selection of the 35 residential wells for the 2011 sampling. Wells were selected based on past sampling frequency, most recent sampling, and potential for trend analysis in organic constituents detected; as recommended in the 2010 Annual Residential Well Sampling Report. All wells selected, were not sampled. The owner of Site #14, tax key 893.9997.002² did not permit Davy Laboratory Staff access to the well for sampling. A substitution was not selected, the owner of the well had indicated future access but it was never provided. Three wells were sampled that were not currently within the database. Well sampling frequency was very diverse, having the majority of the wells sampled in the mid 2000's; one well had not been sampled since 1994. This year, 2011, sampling included wells located adjacent to the Waste Facility property North and South of the Facility, with wells further away from the facility to the East and South as well.

The sampling was performed by Davy Laboratories during August of 2010. The locations are marked on MAP 1 of the report, using Tax ID to identify the property that the well is located on. The Well location data is found in Table 1, providing Property Owner, Property Address, and previous sampling date. Both Map 1 and 2 do not show the locations of properties on Loomis and Ryan Road. The map will be modified as part of the 2012 Annual Well Sampling Report should Loomis and Ryan Road wells be sampled.

Davy sampled only from external locations with immediate connections to the well. They performed purging (discharging of water from the well for at least two minutes) prior to all sample gathering. Samples were handled and returned to the lab following protocols established by the US EPA for drinking water sampling and testing.

Federal Primary Drinking Water Standards

In 2010 the US EPA updated the Federal Primary Drinking Water Standards Maximum Contaminant Level (MCL) for several constituents that are in the protocols. The majority of these constituents are heavy metals, none of the affected constituents have ever been detected in the Franklin WFMC Annual Residential Well Sampling history. In the 2010 Annual Well Sampling report, JSA predicted that the MCL for Sulfate (SO₄) would be reduced from 250 mg/L to 125 mg/L; this regulation change did not occur, the MCL for SO₄ is still 250 mg/L.

The 2011 Annual Residential Well Sampling Laboratory Testing yielded no constituents that exceeded the Federal Primary Drinking Water Standards Maximum Contaminant Level (MCL). Four wells that were tested had a Volatile Organic Compound (VOC), detected above the Limit of Quantification (LOQ), but still several orders of magnitude below the MCL. Due to the contaminant types re-sampling was not warranted.

The constituents detected were Bromodichloromethane, Chlorodibromomethane, Chloroform, and Dichlorodifluoromethane. Each is described in detail below:

² Heritz property – no previous sample date

- Bromodichloromethane - is a trihalomethane, CHBrCL₂, that has historically been used as a flame retardant and solvent. Due to its classification as a trihalomethane it is only used as a reagent or intermediate in organic chemistry. Trihalomethanes are identified as environmental pollutants and carcinogens; they are a common by product of chlorination, created by the reaction between chlorine and natural organic compounds in the presence of ionic bromide. The MCL for Bromodichloromethane is 0.6 mg/L, the Preventative Action Limit (PAL) is 0.06 mg/L.
- Chlorodibromomethane – also known as Dibromochloromethane, CHBr₂CL, is another trihalomethane. It was used for the same purposes as Bromodichloromethane and is formed in the same environment as the other Trihalomethane. The MCL for Chlorodibromomethane is 0.6 mg/L, the Preventative Action Limit (PAL) is 0.06 mg/L
- Chloroform - is an organic compound, CHCL₃, which is a dense liquid at room temperature. It has been used as a refrigerant and solvent in the past and in the medical industry. It belongs to the Trihalomethane family as well, formed in a similar chlorinated environment without the presence of ionic Bromide. The MCL for Chloroform is 6.00 mg/L, the Preventative Action Limit (PAL) is 0.6 mg/L
- Dichlorodifluoromethane – Common name Freon 12 (R-12), CCL₂F₂ previously used as a refrigerant and aerosol propellant. Primarily used in automobile air conditioning systems. Use banned in 1995, but still found as a by product of aerosols such as Albuterol. More research is being done concerning this contaminant found in air and groundwater. The material appears to be less volatile than expected and is found in balanced concentrations between air and water, all over the globe. The lack of Dichlorodifluoromethane in several years of surface water testing suggests that it is a groundwater or sampling location contaminant only. The MCL for Dichlorodifluoromethane is 1,000.00 mg/L and the Preventative Action Limit is 200.00 mg/L. In past years when the incidence of Dichlorodifluoromethane “hits” were frequent, JSA did additional research on the contaminant. The US EPA has identified Dichlorodifluoromethane to be non-cancer causing and non-mutagenic.

All three Trihalomethane family constituents were detected in the Domask³ well. The concentration of the three; Bromodichloromethane at 0.00326 mg/L, Chlorodibromomethane at 0.001 mg/L, and Chloroform at 0.0202 mg/L; are all significantly below the PAL and MCL values that there is no health risk even from prolonged exposure. The neighboring wells do not have any matching constituents, suggesting that the well was treated with an excessive amount of chlorine. If the well owner responds to JSA, we will recommend that future treatment of the well will be conducted by a Wisconsin Licensed Professional.

The Ioder⁴ well contained a concentration of 0.001 mg/L of Chloroform on the date of sampling. The owner was contacted and in the care of the well, chlorine was used; very near the date of sampling; to clean pertinent components. It is unlikely that the constituent is still present in the groundwater being drawn at that well.

The last constituent, Dichlorodifluoromethane was detected in two wells, Heckler⁵ and

³ Colleen Domask, 11808 W. Loomis Road, Franklin, WI 53132 891.9992.000

⁴ Nick and Jackie Ioder, 10338 W. Ryan Road, Franklin, WI 53132 888.9998.001

⁵ Jenny and Steve Heckler, 10810 W. Oakwood Road, Franklin, WI 53132 938.9999.006

Seager⁶ well. The Heckler detection was thought to be a first time occurrence, but after reviewing the database, it would appear that the well was sampled in 2004 (then owned by Werther); the well had been sampled twice between 2004 and 2011 without any VOC detections. The 2011 Dichlorodifluoromethane concentration detected was 0.00543 mg/L greater than the 0.00027 mg/L that was detected in 2004; but both significantly less than the MCL of 1000.00 mg/L. The difference in concentrations should be considered if future sampling detects Dichlorodifluoromethane, this well should be selected for sampling in 2012.

The Seager well has been sampled six times, between 2001 and 2011. Of those sampling events, Dichlorodifluoromethane has been detected below the LOQ for each event. This year the concentration of Dichlorodifluoromethane in the Seager well was above the LOQ at 0.00182 mg/L; significantly below the MCL for the contaminant. This result is higher than the 2010 sampling event as well.

Wells that had previously been sampled, in previous years, that had detections of dichlorodifluoromethane, were also sampled in 2011 and yielded no concentrations of the constituent. Future sampling events will have some focus on wells with previous dichlorodifluoromethane results, however it will not have the primary focus that it did in the 2007 thru 2010 Annual Residential Well Sampling Event.

The Wisconsin Department of Natural Resources also maintains a set of parameters for groundwater contaminants. All constituents detected in the Well Sampling are found in NR 140 – Groundwater Quality. The Public Health Groundwater Quality Standards are similar to the Federal Primary Drinking Water standards.. The VOC's detected in the 2011 Well Sampling had no samples with constituents that exceeded the Preventative Action Limit (PAL), therefore no constituents that exceeded the Enforcement Standard.

JSA identified a repeated trend in detections of Dichlorodifluoromethane throughout the history of the Annual Well Sampling. This year, 2011, a separate map⁷ was developed indicating the location of Dichlorodifluoromethane detections only. The locations of detections on the map are primarily North and South of the Waste Management Metro Facility. The known geography of the area suggests that groundwater flow is toward the facility from North, South, and East. The facility's monitoring wells are sampled quarterly and Dichlorodifluoromethane has not been a constituent detected to date. The Veolia Emerald Park Landfill also has monitoring wells that are sampled quarterly with no history of Dichlorodifluoromethane detections.

To further evaluate a trend, plume, etc of the Dichlorodifluoromethane detections about the Waste Management Metro Facility would require a detailed study of all wells within the database and remapping of the groundwater flow and velocity. As there is no current or pending risk to public health, JSA would not advise the Committee to do further exploration regarding the Dichlorodifluoromethane detections about the facility. JSA recommends that the Committee support Waste Management in any additional work that Waste Management feels prudent to conduct.

6 William A. & Susie L. Seager, 10639 W. 8 Mile Rd., Franksville, WI 53126 012.04.21.05.019.000

7 Map 2

Federal Secondary Drinking Water Standards

The secondary standards act as guide lines for public water systems. Each well that had been previously sampled was compared to its past history. The 2011 Well Samples are consistent with the Well Sampling history and with the groundwater constituents of Southeastern Wisconsin.

Of the constituents measured under the Federal Secondary Drinking Water Standards, Iron (Fe) and Sulfate (SO₄) are detected in excess. Twelve (12)⁸ wells had Iron concentrations higher than 0.3 milligrams per liter (mg/L) and six (6)⁹ well had Sulfate concentrations equal to or greater than 250 mg/L. There is no indication to suggest that these concentrations are anything other than naturally occurring and have been consistent over nearly 15 years of sampling and testing.

In past years of sampling many wells had Sulfate concentrations above 250 mg/L; the majority of these wells are now owned by the landfill or are outside of the defined sampling area. No well in 2011 showed significant changes to the Secondary Drinking Water Standards with regards to previous years results.

Conclusions

The 2011 Well Sampling Laboratory Results yielded the existence of four contaminants. These contaminants have been recorded before and are all beneath the MCL of the Federal Primary Drinking Water Standards. The contaminants were all VOCs and are listed below:

- Members of the Trihalomethane Family
 - Bromodichloromethane
 - Chlorodibromomethane
 - Chloroform
- Dichlorodifluoromethane

Dichlorodifluoromethane concentrations are three orders of magnitude less than any regulatory comment and is not a threat to the property owner. However, the history of the sampled wells shows an increase in concentration. This spring and early summer was very wet, the "Source" (North of the Landfill) of the Dichlorodifluoromethane could very well have been flushed, causing a slug of Dichlorodifluoromethane to move through the groundwater systems. Next years results will provide additional information to support that theory. There is no current or pending threat to human health based on the concentration of the Dichlorodifluoromethane detected in the 2011 Sampling Results.

In addition to the Dichlorodifluoromethane hits, three chemicals from the Trihalomethane family were detected in one well, these chemicals indicate that the well in question was over chlorinated recently. A second well's sample yielded a small concentration of Chloroform, when investigated that well too had received some chlorination treatment. Chloroform is a Trihalomethane, the other two are Chlorodibromomethane and Bromodichloromethane; all three are common byproducts of water chlorination.

8 See Table 3 Results Fe+

9 See Table 3 Results SO₄

The subject wells sampled were consistent with historic sampling results with respect to The US EPA Secondary Drinking Water Standards, exceedances were found in Iron and Sulfate concentrations; but do not pose a threat to public health.

Recommendations

The sampling locations for 2011 were nearly “text book” in alignment and proximity about the Waste Facility. Though the same wells need not be sampled year after year, the Franklin WFMC would be well served to add map location requirements to the 2011 Annual Well Sampling Selection.

JSA recommends 2011 – Residential Well Sampling of:

- Residents Northeast and East
- Wells that have been positive for Dichlorodifluoromethane
 - Seager
 - Heckler
 - Kopp
